**Socio-economic and Demographic Determinants of Utilization of Maternal Health Care Services and their Impact on Infant Mortality in Egypt, 2003.**

This study has tried to accomplish the following objectives to describe and analyze the demographic and socio-economic determinants of maternal health care utilization and their impact on infant mortality.

The study includes:-

- Identification and examination of maternal health care services offered to women in reproductive age.
- An examination of the trends of utilization of maternal health care services (tetanus toxoid injection, antenatal care, medical assistance at child birth, place of delivery and post-natal care) and trends in infant mortality and determination of the factors that influence the utilization of maternal health care services.
- The logistic regression model was used.
- This study relies mainly on secondary data obtained from the final report of demographic health survey in Egypt 2003 and Egypt maternal and child health survey.
