**Differentials and Determinants of Youth Health Status in Egypt, 2009. (317).**

The main goal of this study is to assess the health of young people (10-29) in Egypt. Its attempt to identify the demographic and socio-economic characteristics that affect their health.

The specific objectives are as follows:

- Identifying the levels of young people characteristics.
- Examining the differentials in the young people health in Egypt.
- Examining the determinants for young people health.

The study depends on data obtained from the Survey of Young People in Egypt, 2009 which was conducted by the Egyptian Cabinet – Information and Decision Support Center (IDSC) and Population Council in 2010.

The author depends on Logistic Regression to analyze the relationship between dependent variables, in terms of health indicators and independent variable in terms of demographic and socio-economic characteristics of youth (10-29) age.
