Maternal Morbidity and Mortality in Pakistan, 2006-07.

The Ultimate goal of this research is to identify the most recent levels, patterns and determinants of maternal morbidity in order to help policy makers in achieving. MDG-5, that is improving maternal health by reducing maternal mortality ratio less than 140 maternal deaths by the years 2015.

The research aims to study levels and patterns of maternal morbidity and maternal mortality in Pakistan in 2006-07.

- To examine socio-economic and demographic differentials of maternal morbidity and maternal mortality in the country
- To find out the relationship of antenatal complications as predictors of post partum morbidity.

The main data source for the study is Pakistan Demographic and Health Survey 2006-07.

The study follows both descriptive and analytical approaches.
