The effect of high risk pregnancies on under-five child mortality in Egypt.

The objectives of the present study are to examine:

The maternal factors associated with the high risk pregnancies in Egypt, to examine some of socio economic, demographic and biological factors associated with high risk pregnancies and affect under-five child mortality in Egypt according to the EDHS 2005 data and to assess the net effect of the selected variables on the under-five child mortality.

This study relies on the raw data obtained from the latest Egypt Demographic and Health Survey, EDHS 2005.

The study used the Logistic Regression Model.
