The Relationship between Poverty and Maternal and Child Health Care Services Utilization in Egypt (2000-2008)

This study attempts to examine the impact of poverty on women and child health care utilization. Some socio-economic variables (education, place of residence, housing conditions), demographic, and environmental factors in Egypt were used to study the above mentioned impact.

The study aims at demonstrating the link between poverty and women and child health care services utilization, to identify the determinants of such relation in Egypt.

The main sources of data for this study is Egypt Demographic Health Survey (EDHS) of both 2000 & 2008.

The study follows both descriptive and Multivariate approaches Logistic Regression is a mathematical modeling.
