Determinants of Contraceptive Use and Unmet Need for Family Planning in Rwanda, 2005.

This study attempts to examine levels, trends and differentials of contraceptive use, to examine levels, trends and differentials of unmet need for family planning, and to identify the main factors responsible for the non use of contraception among women with unmet need for family planning, as well as to identify the determinants of contraceptive use of unmet need for family planning. The main source of data in this study is the Rwanda Demographic and Health Surveys in (1992, 2000, and 2005). The study uses the logistic regression model to deal with dependent dichotomous variables more than any other statistical model.
