### **Contraceptive Use& Discontinuation of Family Planning in Bangladesh.**

During the last three decades, Bangladesh made significant progress in many areas including an increase in contraceptive prevalence rate, increase in life expectancy, and increase in literacy rate, decline in infant and child mortality, decline in poverty, decline in unmet need for family planning, etc...

Bangladesh has achieved progressive gains in the broad sphere of reproductive health, family planning, immunization and poverty reduction.

This study tries to examine the levels and trends of family planning practice in Bangladesh, to examine the demographic and socio-economic differentials of contraceptive use& discontinuation in Bangladesh to determine the demographic and socio-economic determinants of contraceptive use& discontinuation in Bangladesh and to analyze the levels and trends of discontinuation of contraceptive use and method switching in Bangladesh

The study is mainly based on the descriptive and analytical techniques to analyze the data of BDHS 1999-2000 by using the multivariate analysis technique which is employed for the advanced statistical analysis of this study.
