Gender Dispirits in HIV/AIDS: Determinants of Perception of Individual HIV/AIDS Risk and Sexual Behavior in Kenya.

The study sets out to explore the prevailing gender disparities in HIV/AIDS in Kenya. However, the main and direct objective of this study is to discover the determinants of perception on individual HIV/AIDS risk and sexual behavior. The study aims to analyzing awareness and attitudes of HIV/AIDS among Kenyan men and women, highlighting the prevalence differentials of HIV/AIDS, Identifying the determinants of individual's AIDS risk perception. Contributing to high prevalence rates despite the high levels of HIV/AIDS. The study used statistical package for social sciences (SPSS) version 10.

The study recommended that it would halt and revise the spread of HIV/AIDS in Kena and also help the government in achieving the MDGs.
