Differentials and Determinants of Child Morbidity and Nutritional Status in Egypt, during the period 2000 and 2008. (310).

The general goal of this study is to identify the most important changes in factors affecting child morbidity and nutritional status in Egypt.

The study specific objectives are:-

- To examine differentials in infant and child mortality in Egypt during 2000 and 2008.
- To investigate differentials in children's nutritional status in Egypt during save period.
- To identify socio-economic, demographic and environmental and illness control determinants of child morbidity and children's nutritional status in Egypt during 2008.

The study depends on Egypt Demographic and Health Surveys (EDHS) of 2000 and 2008. The study uses both Descriptive and Multivariate Analysis to identify the determinants of child morbidity and nutritional status, and their changes over time.
