**Health Inequity among Children in Egypt, 2008. No. [277]**

The objectives of this study are:-

- To identify the level, and determinants of health inequity among children in Egypt in 2008.
- To present an overview of country health services in Egypt.
- To examine to what extent health inequity exists among children.
- To clarify the main socioeconomic, demographic, feeding, and environmental determinants of health inequity among children.
- To suggest some reasonable policy implications to help eliminating health inequity among children in Egypt.

The study used Egypt Demographic and Health Survey 2008.

The author used Logistic regression model to examine the net effect of socioeconomic, demographic, feeding characteristics and housing conditions on health inequity among children.
